Enterprise Architecture Signpost - Project Indigo B2B SSO between IFL and SS&C

1.1 Initiative Details

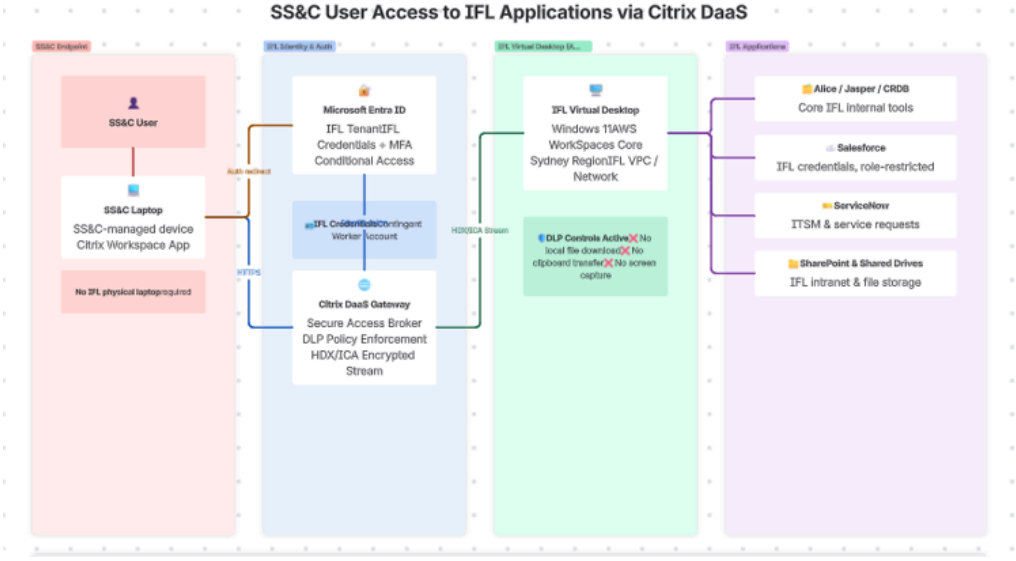

Project Name	Project ID	Project Sponsors	Project Manager	Technology Owner	Linked Approval Item
Project Indigo	IARCH-710: SS&C Transition Program activities (Parent) aka Project Indigo In Progress	@Stuart Develyn	@Tom Collins	@Joshua Hurle	

1.2 Initiative Summary

The transition of Master Trust operations to SS&C and the retention of other Master Trust functions by IFL has resulted in a number of use cases that require both IFL and SS&C staff to have access to the same applications. Those applications may be either IFL or SS&C applications.

This initiative provides patterns to enable staff from either organisation to access applications in the other organisation utilising their own organisation's credentials via SSO

1.2.1 Current State Diagram

The current state provides SS&C staff with access to IFL applications from their SS&C laptops utilising their IFL credentials and Citrix

There is no equivilent flow that provides access to SS&C systems for IFL staff

1.3 Solution Context

The solution provides standard patterns to enable identity federation between IFL and SS&C allowing users in each organisation to access applications in the other organisation utilising the credentials they hold within their own organisation.

It further considers solutions for

- user management - onboarding, offboarding and movement
- user access review
- use of MFA in authentication

1.4 Solution Summary

The solution utilises a standard Business to Business Identity Provider federation to support sign on to applications across businesses.

- A two way federation between IFL's Entra and SS&C's Keycloak will support the passing and validation of claims for access to applications.
- Membership of AD groups indicating access to applications in the other business will provide coarse grained access to the application.
- Fine grained access for each user will be controlled within the application
- MFA will be managed by the IDP which validates the users credentials

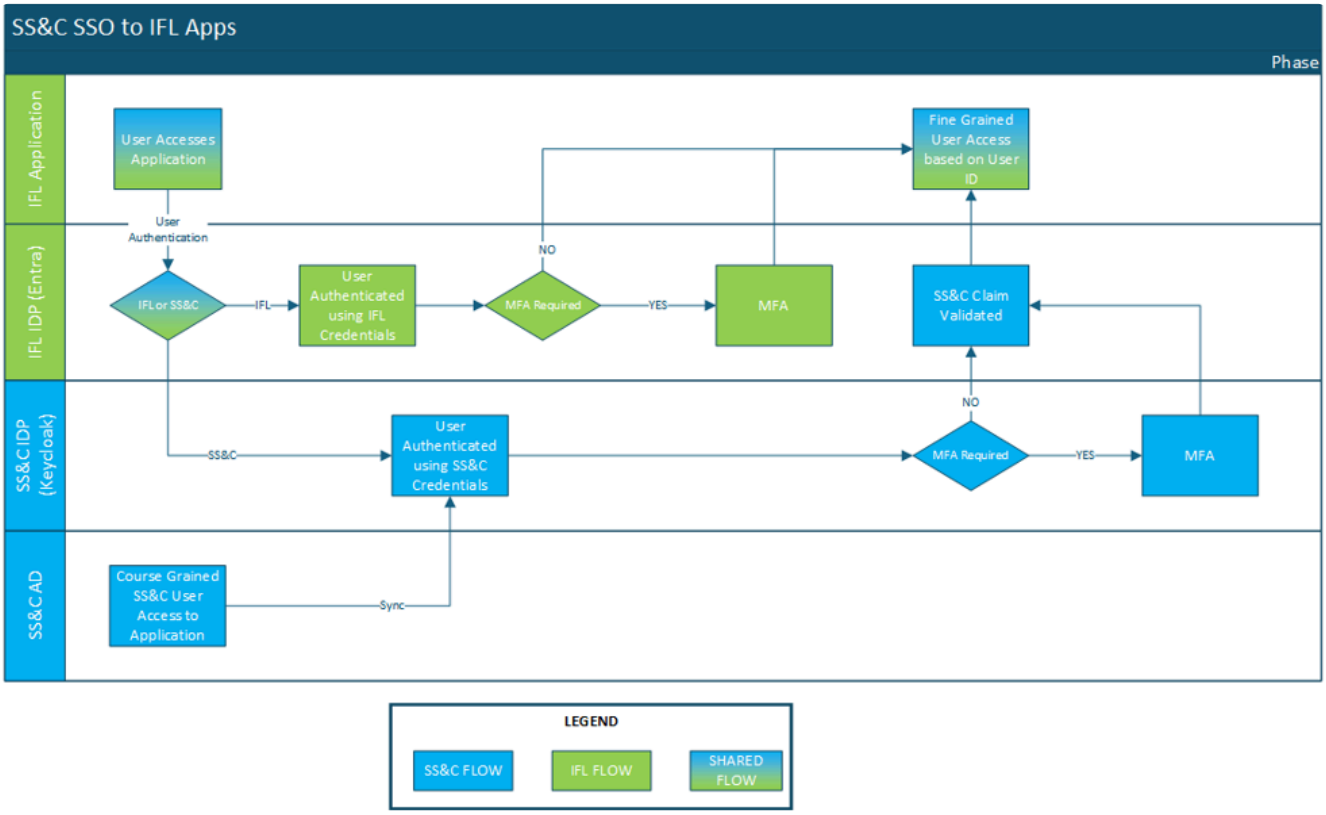

- Initial user onboarding will be completed as part of each Indigo transition (Masterkey, P&I and Plum)
- Ongoing onboarding will be a 2 step process with one business setting up coarse grained access in their AD group(s) and the other business provisioning fine grained access in the application(s)
- Offboarding will occur at the coarse grained access level as users' AD privileges are revoked
- Application UAR's will be sent to the other business to support offboarding from individual applications

SS&C Users Accessing IFL Applications

IFL Users Accessing SS&C Applications

Indicative Onboarding Flow

This flow is indicative intending to show the key actions and responsibilities of IFL and SS&C to onboard a new user to an application. The precise operating model is being determined.

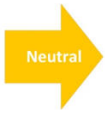

The diagram shows the flow for onboarding an IFL employee to an SS&C application. Roles and responsibilities would be reversed for onboarding an SS&C employee to an IFL application.

Solution Limitation

This solution is limited to IFL applications which support Entra authentication. While there are IFL applications which do not support Entra none have been identified for which SS&C would need access.

The solution is equally limited to SS&C applications which support Keycloak authentication. Again no applications have been identified that do not support Keycloak and which IFL need access to.

1.5 Enterprise Architecture Signposts

Overall	Business	Application	Information	Integration	Infrastructure	Security
						

Overall

Provides an efficient and simple solution to the business without downgrading other areas. Allows the removal of IFL credentials from SS&C users

Business

Provides business users across both organisations with appropriate levels of access to applications required to perform their roles

Application

Utilises existing fine grained access controls within the applications

Information

Provides users with information required to perform their roles while managing and protecting data utilising existing controls

Integration

Provides a single pattern to support access to multiple applications within each organisation

Infrastructure

Utilises existing infrastructure

Security

Uses appropriate controls including MFA to support authentication and authorisation.

The split of coarse and fine grained authorisation provides controls to both organisations.

The application of appropriate data protection controls within each organisation provides data security

Reduces exposure by removing IFL credentials from SS&C users

Customer

Many of the use cases requiring cross business access support customer facing processes including Complaints and Claims management. This solution should make interactions between the two businesses seamless to the customer
